# Problem Statement

1.The problem statement is to design a college prediction/ prediction system and to provide a probabilistic insight into college administration for overall rating, cut-offs of the colleges, admission intake and preferences of students.

2. It has always been a troublesome process for students in finding the perfect university and course for their further studies.

3.At times they do know which stream they want to get into, but it is not easy for them to find colleges based on their academic marks and other performances.

4.We aim to develop and provide a place which would give a probabilistic output of how likely it is to get into a university given their details.

### WHO?

Who does the problem affect?

Students who apply admission in university

#### WHAT?

What is the issue?

Students don't know what are eligibility criteria to a particular university.

#### WHEN?

When does the issue occur?

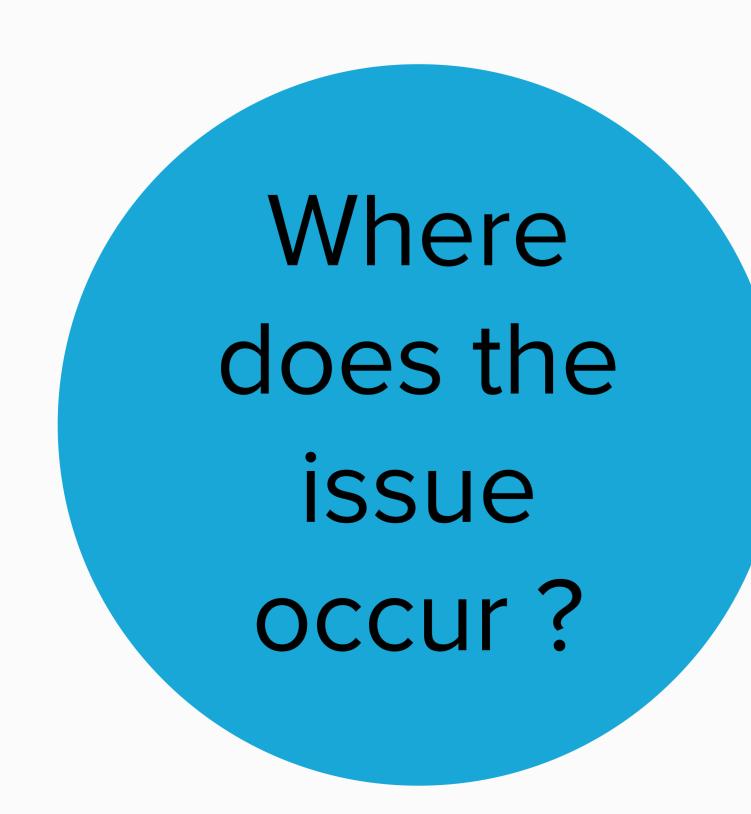

While students trying to apply for a university

#### WHY?

Why is it important that we fix the problem?

So that students don't waste their time and money in applying for every university which they are not eligible.

## WHERE?

This issue occurs among students who don't have any idea "Which university they are eligibility to apply".
